INDEPENDENT UX CASE STUDY

Improving Supplier Qualification UX in Life Sciences

A deep case study based on Qualifyze's product ecosystem: audit workflows, CAPA visibility, and AI-driven risk monitoring.

ROLE
Product Designer (Case Study)

DURATION
1 Week

SCOPE
Research + UX Audit + Concept Direction

METHOD
Secondary Research

Project Summary

Supplier qualification in life sciences is slow, compliance-heavy, and often fragmented across spreadsheets, email, and disconnected systems. This study examines Qualifyze's current product model and identifies high-impact UX opportunities to improve speed, visibility, and confidence for QA and procurement teams.

Audit Management · Supplier Onboarding · CAPA Tracking · Risk Intelligence

Problem Framing

Business Problem

Qualification delays increase operational and regulatory risk. Teams need faster decisions without compromising compliance quality.

User Problem

QA and procurement users often lack a single place to understand supplier risk, audit status, and CAPA progress in a decision-ready format.

Research Approach

1 **Product Teardown**

Mapped key workflows: onboarding, audit request and execution, report lifecycle, and CAPA follow-up.

2 **Domain and Compliance Scan**

Reviewed GxP and regulated supply-chain constraints to understand traceability and data-integrity expectations.

3 **Comparative Benchmark**

Compared Qualifyze's positioning against audit-management and broader QMS-style platforms.

What I Learned

Insight 1

Onboarding remains the highest-friction stage despite strong audit-library assets.

Insight 2

Risk and CAPA are logically connected but visually separated, which increases decision effort.

Insight 3

Dashboards communicate status, but not always action priority for time-sensitive tasks.

Current Workflow Diagnosis

1. **Supplier identified:** Procurement initiates qualification with limited context.
2. **Audit data search:** Teams inspect existing reports across standards/regions/sites.
3. **Audit decision:** Join existing audit or request new audit execution.
4. **Findings and CAPA:** Nonconformances become CAPAs with multi-owner follow-up.
5. **Risk reassessment:** Teams manually connect CAPA closure with supplier risk changes.

Opportunity Prioritization

High Impact / Medium Effort

- Unified supplier risk + CAPA workspace
- Action-first risk sorting with urgency states
- Guided supplier onboarding steps

Medium Impact / Low Effort

- Saved filters by role (QA vs Procurement)
- Overdue CAPA reminders by ownership
- Confidence labels for AI risk scoring

Proposed Direction

Unified Supplier Risk Workspace

Design a supplier-level command view that combines risk score, open CAPAs, audit history, and recommended next actions. The goal is to reduce analysis overhead and make escalation decisions faster and clearer.

Risk Layer

Current score, trend, and trigger explanation.

CAPA Layer

Open items, owners, due windows, and blocker flags.

Action Layer

Recommended action: monitor, re-audit, or escalate.

Success Metrics (If Implemented)

OPERATIONAL

Time to Qualified Supplier

Track cycle-time reduction from request to decision.

COMPLIANCE

On-time CAPA Closure Rate

Monitor overdue reductions and owner accountability.

UX

Decision Confidence Score

Measure user confidence in risk prioritization decisions.

Validation Plan (Next Step)

- Conduct 8 to 12 interviews across QA leads, procurement managers, and auditors.
- Run task-based usability testing on prioritization and CAPA follow-up scenarios.
- Evaluate trust and interpretability of AI risk explanations.

Limitations and Integrity Notes

This case study is based on secondary research and public product information. It includes directional assumptions where primary evidence was unavailable. Numeric claims from vendor material were not independently validated in this study.

Reflection

The strongest takeaway is that compliance UX is not just about visibility, it is about decision clarity under risk. A good enterprise dashboard shows status; a great one reduces uncertainty and next-step ambiguity.
